

# NPC Board2Code Hackathon 2026

## Game Reveal Document – Tiki Topple

---

### 1. Hackathon Overview

NPC Board2Code Hackathon 2026 is a **24-hour intensive hackathon** where teams are required to design, build, and present a complete digital product under strict time constraints.

- **Organized by:** NetPractice Campus
- **Hosted at:** Lovely Professional University – Department of Computer Science
- **Dates:** 9-10 April 2026
- **Duration:** 24 Hours

Participants must build a **digital implementation of the board game “Tiki Topple.”**

---

### 2. Objective of the Hackathon

The hackathon is designed to evaluate:

- Problem-solving ability
  - Algorithmic thinking
  - Software design and development
  - Team collaboration
  - Ability to execute under time constraints
- 

### 3. Game Overview – Tiki Topple

**Youtube Video Explanation Link:**

<https://www.youtube.com/watch?v=NqhU5RjE0o0>

Tiki Topple is a **turn-based strategic stacking game** where players manipulate the order and movement of tokens to maximize their final score.

The core challenge lies in:

- Controlling token order
- Planning moves ahead
- Adapting to opponent actions

## 4. Game Setup

- Number of players: 2–4
  - All tokens are placed in a **single vertical stack** at the starting position
  - The board is a **linear track** with positions ( $0 \rightarrow N$ )
- 

## 5. Core Mechanics

### 5.1 Stack-Based Gameplay

- Tokens (tikkis) exist in a **stack (top  $\rightarrow$  bottom)**
  - Only the **top tokens are accessible**
  - The order of tokens determines gameplay possibilities
- 

### 5.2 Turn Structure

Players take turns in sequence.

On each turn, a player can perform **one action**.

---

### 5.3 Allowed Actions (Mandatory Implementation)

#### 1. Move Top Tokens

- Move top **1, 2, or 3 tokens forward by 1 step**
  - Order must remain unchanged
- 

#### 2. Reorder Top Tokens

- Select top 2–3 tokens
- Rearrange their order
- Place them back on top

---

## 5.4 Optional Enhancements (Bonus)

- Multiplayer (online/local)
  - AI opponent
  - Advanced movement rules
  - Animations and improved UI
- 

## 6. Game Progression

- Tokens move forward across the track
  - Stack order keeps changing
  - Players influence both their own and opponents' tokens
- 

## 7. End Condition

The game ends when:

- All tokens reach the final position  
**OR**
  - A fixed number of turns (recommended: 20–30 turns) is completed
- 

## 8. Scoring System

At the end of the game:

- Tokens are ranked based on their final positions

### **Suggested Scoring:**

- 1st position → Highest points
- 2nd position → Lower
- and so on

Each player's score = total points of their tokens

## 9. Technical Guidelines

Participants are free to use any:

- Programming language
- Framework
- Technology stack

Allowed platforms:

- Web applications
- Mobile apps
- Desktop applications

Rules:

- Open-source libraries allowed
  - Core game logic must be built by the team
- 

## 10. Submission Requirements

Each team must submit:

- Source code Github repository
  - Working demo / executable
  - Documentation including:
    - Game rules implementation
    - Architecture and tech stack
  - Optional: Demo video
- 

## 11. Evaluation Criteria

Submissions will be judged on:

- Correctness of game logic
- Completeness

- UI/UX quality
  - Code quality
  - Innovation (bonus features)
- 

## 12. Expectations from Teams

By the end of 24 hours:

- A playable and stable version of the game
  - Core mechanics implemented correctly
  - Judges should be able to run and test the project
- 

## 13. Constraints & Clarifications

- Focus on **functionality over perfection**
  - Keep scope manageable within 24 hours
  - Any assumptions made must be documented
  - Judges' interpretation will be final
- 

## 14. FAQs

### Q1. Do we need to exactly replicate the original Tiki Topple rules?

No. You need to implement the **core concept (stack + movement + strategy)**. Minor simplifications are allowed, but must be documented.

---

### Q2. Can we modify or simplify rules?

Yes, if needed for feasibility within 24 hours. Clearly mention all assumptions.

---

**Q3. Can we build only frontend or only backend?**

No. A **complete playable game** is expected.

---

**Q4. Is multiplayer mandatory?**

Yes. Atleast 2 players are needed to play the game.. More than that is a bonus.

---

**Q5. Can we use AI tools or libraries?**

Yes, but **core logic must be your own**.

---

**Q6. What happens if our game is incomplete?**

Partial implementations will be evaluated, but **completeness will significantly impact scoring**.

---

**Q7. Can we reuse previous code/projects?**

No. The solution must be built during the hackathon.

---

**Q8. What matters more: UI or logic?**

Correct game logic is more important than UI.

---

**Q9. Can we deploy the project?**

Yes, and it is encouraged.

---

**Q10. How will judging happen?**

Teams will demonstrate their working product and explain:

- Game logic
  - Implementation approach
  - Key decisions
- 

## 15. About NetPractice Campus

NetPractice Campus works with institutions to strengthen Computer Science fundamentals through structured practice, hands-on problem solving, and industry-aligned training programs.

---

## 16. Rule Framework (Very Important)

### A. Locked Rules (Mandatory – Cannot Be Changed)

These ensure fairness and consistent judging.

#### Core Gameplay

- The game must be **turn-based**
  - All tokens must start in a **single stack**
  - Only **top tokens (1–3)** can be interacted with
  - Players can perform **only one action per turn**
  - Tokens can only move **forward on the track**
- 

#### Required Actions

Every implementation must include:

- **Move Action**  
Move top 1–3 tokens forward by 1 step (order preserved)
  - **Reorder Action**  
Rearrange top 2–3 tokens and place them back
-

## Game Completion

- The game must have a **clear end condition**
  - The game must include a **scoring system**
  - The game must be **playable end-to-end**
- 

## Technical

- Core game logic must be implemented by the team
  - A working demo must be provided
- 

## B. Flexible Rules (Teams Can Customize)

These allow creativity without breaking fairness.

- Board size (length of track)
  - Number of turns OR end condition logic
  - Scoring formula (as long as ranking-based)
  - UI/UX design
  - Multiplayer vs single-player
  - AI implementation
  - Additional mechanics (power-ups, variations, etc.)
- 

## C. What Will Lead to Disqualification / Penalty

- No working demo
  - Core mechanics missing (stack / movement / turns)
  - Completely unrelated implementation
  - Plagiarized or pre-built solution
-
